## ABSTRACT

The genus *Stenhelmoides* comprises 15 species spread over all Central and South America and its greatest species richness is clearly associated with Amazonian regions. Based on examination of type specimens and additional material, we describe and illustrate the true male genitalia of *Stenhelmoides strictifrons*, which had until now been incorrectly illustrated in the literature. We also report new records of the genus *Stenhelmoides* from Brazil and Guyana. In addition to pictures of the species' *habitus*, we provide pictures of the type specimens of *Stenhelmoides grandis*, *S. grouvellei*, *S. guyanensis*; *S. strictifrons* and *S. submaculus*. Based on the International Code of Zoological Nomenclature, we recognize additional paralectotypes for *S. guyanensis* and for *S. grouvellei*.

**KEYWORDS:** riffle beetles, aquatic insects, morphology, Neotropics, taxonomy

## Notas sobre *Stenhelmoides* e descrição da genitália verdadeira do macho de *S. strictifrons* Grouvelle, 1908 (Coleoptera: Elmidae)

## RESUMO

O gênero *Stenhelmoides* compreende 15 espécies espalhadas por toda a América Central e do Sul e sua maior riqueza de espécies está claramente relacionada às regiões amazônicas. Com base no estudo de espécimes-tipo e material adicional, nós descrevemos e ilustramos a genitália verdadeira do macho de *Stenhelmoides strictifrons*, que, até então, estava representada de maneira equivocada na literatura. Nós também reportamos novos registros de *Stenhelmoides* para o Brasil e Guiana. Além de imagens do *habitus* das espécies, fornecemos fotografias dos espécimes-tipo de *Stenhelmoides grandis*, *S. grouvellei*, *S. guyanensis*; *S. strictifrons* e *S. submaculus*. De acordo com as regras e recomendações do Código Internacional de Nomenclatura Zoológica, reconhecemos paralectótipos adicionais das espécies *S. guyanensis* e *S. grouvellei*.

**PALAVRAS-CHAVE:** besouros de correnteza, insetos aquáticos, morfologia, Neotrópico, taxonomia

## INTRODUCTION

Elmidae Curtis, 1830 is a cosmopolitan family of Coleoptera with around 1503 known species distributed in 151 genera (Jäch *et al.* 2016; Short 2018). The family has its greatest richness and abundance in the Neotropical region (Jäch and Balke 2008) and, as expected, the Amazonian elmid fauna is very diverse.

The genus *Stenhelmoides* Grouvelle, 1908 comprises 15 species distributed throughout the Neotropical region, from

Mexico to Paraguay (Jäch *et al.* 2016). Despite being more likely associated with Amazonian regions, where most of the known species can be found, the genus seems to potentially occur in many kinds of Neotropical biomes.

Grouvelle (1908) described *Stenhelmoides* based on two species, *Stenhelmoides strictifrons* and *Stenhelmoides guyanensis* from French Guiana (Rivière Lunier, Tumuc Humac), but without designating a type series, nor did he mention the number of specimens examined for either species. Delève, in the 1960s, examined Grouvelle's collection and designated

**CITE AS:** Fernandes, A.S.; Polizei, T.T.S.; Boldrini, R. 2020. Notes on *Stenhelmoides* and description of the true male genitalia of *S. strictifrons* Grouvelle, 1908 (Coleoptera: Elmidae). Acta Amazonica 50: 317-326.

types for many species, including the “holotype” for *S. strictifrons*, based on a female specimen (Spangler and Perkins 1989). Despite having labelled the specimen, Delève (1970) did not include this information in his subsequent publication about *S. strictifrons*. Finally, Spangler and Perkins (1989) revised the genus *Stenhelmooides*, and redescribed all known species, including *S. strictifrons*. They also chose a male from Grouvelle’s collection, labeled similarly to the “holotype”, to include in the type series as a paralectotype. They described and illustrated its genitalia.

After carefully checking specimens of *Stenhelmooides strictifrons* from many localities of Brazil and examining the type specimens (lectotype and paralectotype) housed in the Muséum National d’Histoire Naturelle, Paris, we concluded that the male genitalia of the species was incorrectly illustrated by Spangler and Perkins (1989). To rectify the morphological description of the species and avoid potential errors by other researchers when trying to identify *Stenhelmooides* species, we describe and illustrate the correct male genitalia of *S. strictifrons*.

We also report new records for *Stenhelmooides beebei* Spangler and Perkins, 1989, *Stenhelmooides stegastus* Spangler and Perkins, 1989, *Stenhelmooides strictifrons* Grouvelle, 1908, *Stenhelmooides platysternum* Spangler and Perkins, 1989, and *Stenhelmooides variabilis* Spangler and Perkins, 1989 in Brazil, and *S. stegastus* and *S. variabilis* in Guyana. These are the first records for *Stenhelmooides* in the Brazilian states of Amapá, Bahia, Minas Gerais, Roraima and Tocantins. For the first time, *habitus* photographs of type specimens of the following species are provided: *Stenhelmooides grandis* Spangler and Perkins, 1989, *Stenhelmooides grouvellei* Pic, 1923, *Stenhelmooides guyanensis* Grouvelle, 1908, *S. strictifrons* Grouvelle, 1908, and *Stenhelmooides submaculus* Hinton, 1937.

Based on examination of the type series housed in the collection of the Muséum National d’Histoire Naturelle, Paris and following information provided in Spangler and Perkins (1989), Monte and Mascagni (2016), and Polizei and Casari (2019), we recognized one type specimen of *S. guyanensis* as a paralectotype and several paralectotypes of *S. grouvellei*.

## MATERIAL AND METHODS

The material studied came from different Brazilian and international collections (listed below). Species level identifications were made using the taxonomic key of Spangler and Perkins (1989), original species descriptions and examination of type material. A Leica MS5 (Wetzlar, Germany) stereoscopic microscope was used for morphological studies and a Canon EOS550D (Tokyo, Japan), attached to a Leica N205A (Wetzlar, Germany) stereoscopic microscope, was used to photograph the specimens. Images were treated on Combine ZM and Adobe Photoshop.

For examination of male genitalia, the aedeagi were extracted from the specimens, cleared in heated 10% KOH for five minutes (Brown 1972) and mounted on temporary slides with glycerin. Pictures were taken with the aid of a light microscope Nikon model Eclipse E200 (Tokyo, Japan), equipped with BIOPTIKA CMOS-10.0. Drawings were made on Camara Lucida and digitalized on Adobe Illustrator. Dissected genitalia were stored in microvials with glycerin attached to the same pin as the specimen.

The general morphological terminology follows Kodada *et al.* (2016). Specimen labels are quoted verbatim. Change of lines are indicated by “/” and different labels are separated by “//”. Localities followed by “\*\*” represent new records.

The following collections were visited and/or contain deposited specimens (curator in parentheses):

CELAMARH – Coleção Entomológica do Laboratório de Meio Ambiente e Recursos Hídricos, Universidade Federal de Goiás – Goiânia, Goiás, Brazil (Leandro G. Oliveira);

CEUFT – Coleção de Entomologia da Universidade Federal do Tocantins, Laboratório de Entomologia – Porto Nacional, Tocantins, Brazil (Tiago K. Krolow);

CZMT-CEMT – Setor de Entomologia da Coleção Zoológica da Universidade Federal de Mato Grosso, Departamento de Biologia e Zoologia – Cuiabá, Mato Grosso, Brazil (Fernando Vaz-de-Mello);

DZUFRJ – Coleção José Alfredo Pinheiro Dutra, Departamento de Zoologia, Instituto de Biologia, Universidade Federal do Rio de Janeiro – Rio de Janeiro, Rio de Janeiro, Brazil (Nelson Ferreira-Jr);

INPA – Coleção de Invertebrados, Instituto Nacional de Pesquisas da Amazônia – Manaus, Amazonas, Brazil (Márcio Oliveira);

MNHN – Muséum National d’Histoire Naturelle – Paris, France (Thierry Deuve);

MZSP – Museu de Zoologia da Universidade de São Paulo – São Paulo, São Paulo, Brazil (Sônia A. Casari);

NHMUK – Natural History Museum – London, UK (Max Barclay).

## RESULTS

### *Stenhelmooides* Grouvelle, 1908

(Figures 1 – 3)

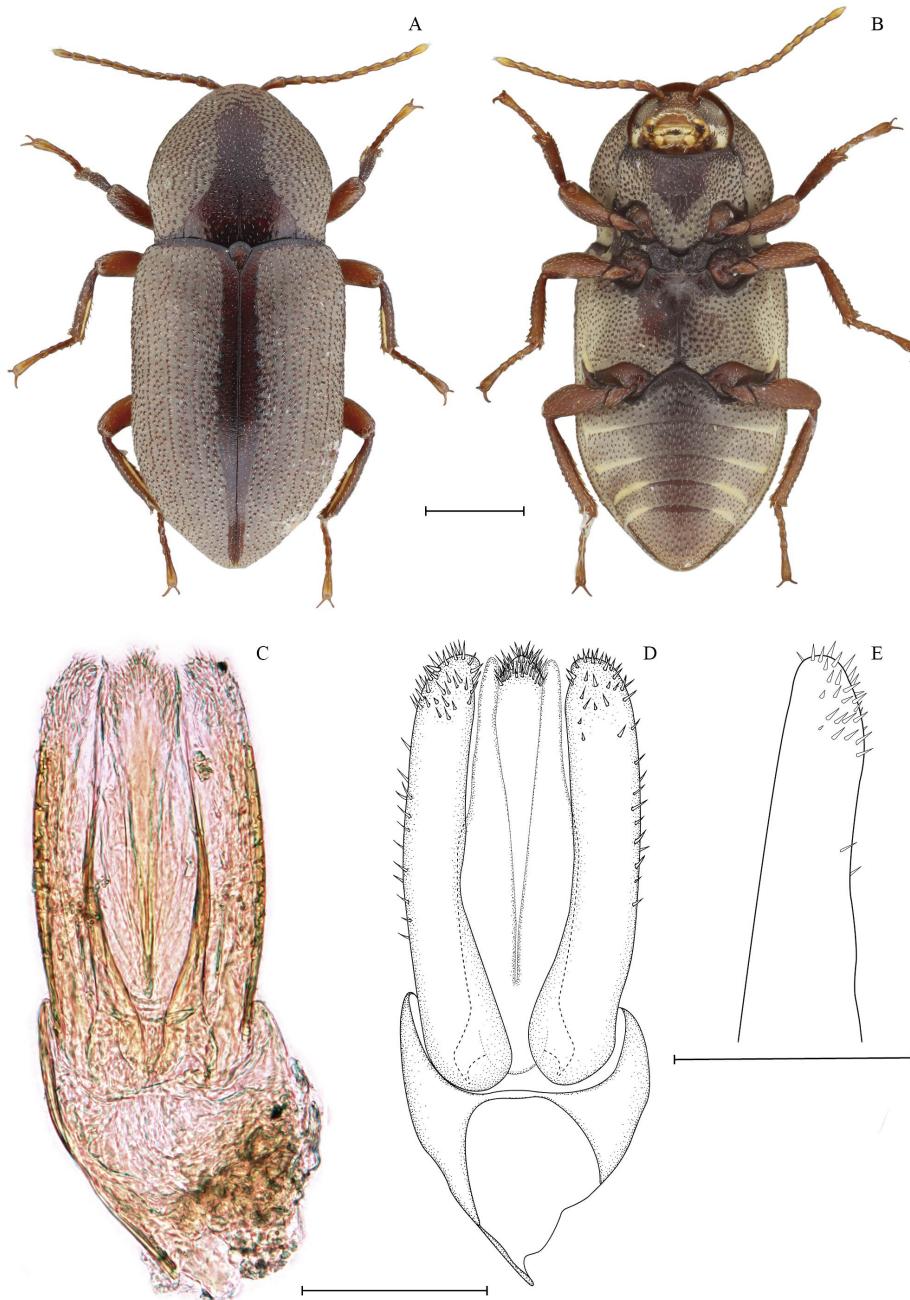

### *Stenhelmooides strictifrons* Grouvelle 1908

(Figures 1, 3e)

**Diagnosis.** (Modified from Spangler and Perkins 1989)

*Stenhelmooides strictifrons* can be distinguished from all species of *Stenhelmooides* by its small size (2.04 – 2.52 mm), the dorsal plastron pattern on the pronotum, the metaventrite being slightly depressed, the elytral granules organized in rows, the absence of hair-like setae tufts on tarsi and the male genitalia with the apical surface of the parameres and median lobe densely covered with spine-like setae (Figures 1c–e).

**Male genitalia.** Phallobase (Figures 1c, d) broad and short. In dorsal view, 1.3 times broader at base than parameres and three-fifths their length. Parameres (Figures 1c–e) as long as median lobe. In dorsal view (Figures 1c–d) not tapering to apex, slightly curved toward median lobe, apices feebly invaginated on internal lateral margin, rounded and covered with distinct spine-like setae over apical one-fifth. In lateral view (Figure 1e) dorsal margin nearly straight, ventral margin sinuous, apex rounded, spine-like setae concentrated on apical

**Figure 1.** *Stenhelmooides strictifrons* Grouvelle, 1908, Male. Habitus (MZSP 31442): A – dorsal view; B – ventral view. Aedeagus: C – dorsal view; D – ventral view; E – apex of paramere in lateral view. Scale bar: (A–B) = 0,5 mm, (C–E) = 0,1 mm. This figure is in color in the electronic version.

portion of ventral margin and pointed to venter. Median lobe long and richly adorned with spine-like setae. In dorsal view (Figures 1c-d) surrounded by dehiscent membranous structure, apex rounded and densely covered with spine-like setae thinner than those of the parameres. In lateral view completely covered by the parameres.

**Type locality:** French Guiana: Riviére Lunier.

**Distribution:** Brazil (Amapá\*, Amazonas\*, Bahia\*, Goiás, Mato Grosso, Minas Gerais\*, Pará, São Paulo, Tocantins\*), French Guiana, Guyana, Peru, Venezuela.

#### Type material remarks

*Stenhelmoides grandis* Spangler and Perkins, 1989  
(Figure 3a)

**Material examined:** 1 paratype female; ♀ // lectotype [label turned upside down to indicate its invalidity, probably done by Spangler] // MUSEUM PARIS / GUYANE / RIVIÈRE LUNIER / F.GEAY 1899 // *Stenhelmoides / guyanensis* / Grouv // J. Deléve det. 1967 / *Stenhelmoides / guyanensis* Gr. // THIS IS A NEW SPECIES, STENHELMOIDES GRANDIS / SPANGLER & PERKINS / SEE DELEVE'S 1966 S?M. / IT BEARS A "TYPE" LABEL / & FITS GROUVELLE'S / DESCRIPTION CORRECTLY. PJ.SPANGLER // PARATYPE / *Stenhelmoides / grandis* / PJ Spangler & / PD Perkins // Muséum / Paris (MNHN).

**Condition:** The paratype is glued on a card and it is slightly damaged. Missing parts include the right foreleg. Ventrites IV–V and the female genitalia are glued to a card pinned below the specimen.

**Comments:** This exemplar was initially designated as the lectotype of *S. guyanensis*. However, in the revision of the genus, Spangler and Perkins (1989) described it as a new species (*S. grandis*) designating this specimen as one of the paratypes.

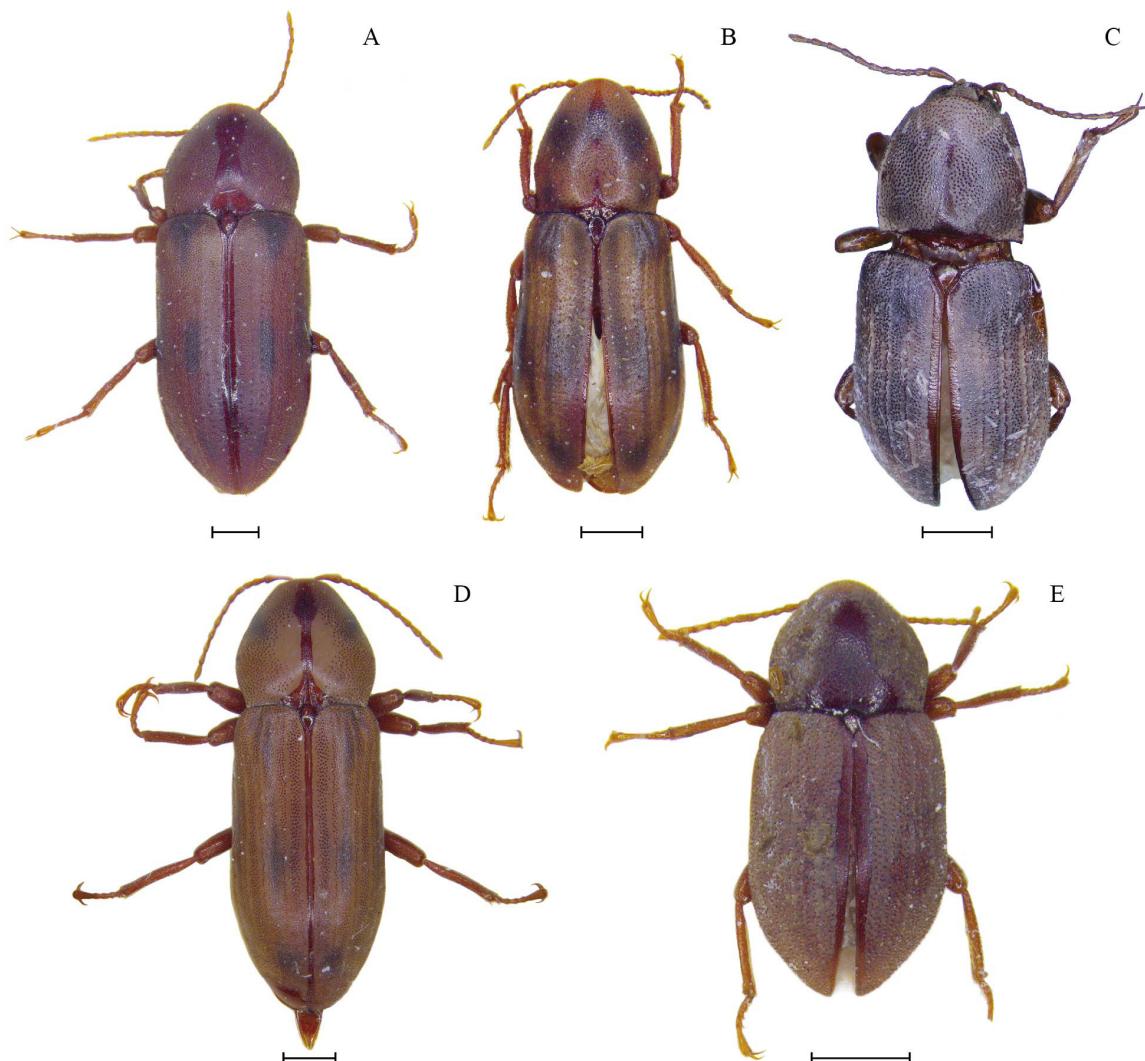

*Stenhelmoides grouvellei* Pic, 1923  
*Stenelmoides grouvellei* Pic, 1923:4  
(Figure 3b)

**Material examined:** Paralectotype (recognized here): ♂ // GUYANE FRANÇSE / Nouveau Chantier / COLLECTION LE MOULT // SEPTEMBRE // MUSÉUM PARIS / Collection / Leuirole // Prepar. genit / 3766.6 // *Stenhelmoides / strictifrons* Grouv. / Type // J. Deléve det. 1966 / Stenelsianus / strictifrons Grouv // STENHELMOIDES / GROUVELLEI / PIC, / NOT STRICTIFRONS / AS LABELED!! / PJ.SPANGLER, 1983 // Muséum / Paris (MNHN).

**Condition:** The paralectotype is glued on a card and is in perfect condition. The male genitalia was extracted by Deléve and mounted on a slide [Prepar. genit 3766.6].

**Comments:** This species was described by Pic (1923); however, he did not provide any information about the type series (syntypes), only the type locality as "Guyane Fr.". During their revision, Spangler and Perkins (1989) found one specimen labeled as "type" (handwritten label) and three other conspecific specimens in MNHN (one without identification and two misidentified as *S. strictifrons* by Deléve in 1966). Spangler and Perkins determined all specimens as *S. grouvellei*. These three conspecific specimens were from French Guiana [very old labels]. Spangler and Perkins treated the specimen bearing the type label as the "holotype" (see Spangler and Perkins, 1989:42) designating it as the lectotype for *Stenhelmoides grouvellei* and the other three remaining specimens as paralectotypes (ICZN 1999, Art. 74.6). In 2017, T.T.S. Polizei found the lectotype and just one of the two paralectotypes examined by Spangler and Perkins (1989) at the MNHN. Based on the similarity of the labels and the observations of Spangler we confirmed that this specimen is one of the syntypes from Pic (1923) and is therefore a paralectotype.

*Stenhelmoides submaculatus* Hinton, 1937  
*Stenelmoides submaculatus* Hinton, 1937:109  
(Figure 3c)

**Figure 3.** Types of some *Stenhelmooides* Grouvelle, 1908, Habitus in dorsal view. A–B, D–E – housed in MNHN; C – housed in NHMUK. A – *S. grandis* Spangler & Perkins, 1989 [Paratype]; B – *S. grouvellei* (Pic, 1923) [Paralectotype]; C – *S. submaculatus* Hinton, 1937 (BMNH010584113) [Paratype]; D – *S. guyanensis* Grouvelle, 1908 [Paralectotype]; E – *S. strictifrons* Grouvelle, 1908 [Lectotype]. Scale bar = 0,5 mm. This figure is in color in the electronic version.

**Material examined:** 1 paratype female; ♀ // Espir. Santo / x.1920-11.1921 // F.Hoffman coll. / Arp. dedic. 1921 // paratype / *Stenelmooides submaculatus* Hinton. // H.E.Hinton collection. / BM. 1977-566 // BMNH010584113. (NHMUK).

**Condition:** The paratype is glued on its right side to a triangle and it is slightly damaged. Missing parts include the two apical tarsomeres and claws on the left hind leg. Ventrates I–V and the female genitalia are glued on the same triangle as the specimen.

*Stenhelmooides guyanensis* Grouvelle, 1908  
(Figure 3d)

**Material examined:** Paralectotype (recognized here): ♀ // MUSEUM PARIS / GUYANE / RIVIÈRE LUNIER /

TUMUC HUMAC / F.GEAY 1899 // J. Deléve det. 1967 / *Stenhelmooides / guyanensis / Grouv* // Muséum / Paris (MNHN).

**Condition:** The paralectotype is glued on a card and it is in perfect conditions. There are no missing parts and the female genitalia are still preserved in the specimen.

**Comments:** In the original description of the species, Grouvelle (1908) based the species on the five specimens from Rivière Lunier et Bas-Carsevenne. However, in their revision, Spangler and Perkins (1989) studied Grouvelle's collection housed at MNHN and found just two specimens labeled as "*Stenhelmooides guyanensis*" by Deléve. One of these is not conspecific with the species, and Spangler and Perkins regarded it as a new species [this exemplar is one of the paratypes of *S. grandis* Spangler and Perkins, 1989, Figure 3a]. The other specimen (a female) was designated as the lectotype

by Spangler and Perkins (1989). During a visit to the MNHN in 2017, T.T.S. Polizei found another specimen with the same data as the lectotype and also determined as "*Stenhelmooides guyanensis*" by Deléve in 1967. There is no doubt that this specimen is one of the specimens that Grouvelle reported as "5 exemplars" in the original description. Besides, this species has the pronotum distinct, without granules on the disc, a condition unique among all the species of *Stenhelmooides*. This syntype is herewith recognized as paralectotype.

*Stenhelmooides strictifrons* Grouvelle, 1908

(Figure 3e)

**Material examined:** Lectotype; ♀ // MUSEUM PARIS / GUYANE / RIVIÈRE LUNIER / TUMUC HUMAC / F.GEAY 1899 // Holotype // Muséum / Paris. (MNHN).

**Condition:** The lectotype is glued on a card and it is slightly damaged. Missing parts include the apical tarsomeres and claws on the right hind leg. Ventrates I–V and the female genitalia are glued to a card pinned below the specimen.

## DISCUSSION

Despite the very careful revision, for some unknown reason, Spangler and Perkins (1989) incorrectly illustrated the male genitalia of *S. strictifrons*. The error was first noticed in 2011 by A.S. Fernandes while examining the male (paralectotype) of *S. strictifrons* from Grouvelle's collection housed in the MNHN. Fernandes also discovered that *Stenhelmooides* specimens from different regions in Brazil he had already determined as a new *Stenhelmooides* species (based on the very distinct male genitalia) were actually specimens of *S. strictifrons*. Later, A.S. Fernandes and T.T.S. Polizei examined several specimens of *S. strictifrons*, including the lectotype (female), to confirm that the male genitalia clearly differed from those shown in Spangler and Perkins (1989).

Despite being widespread in the Neotropics and very conspicuous due to its large size, characteristic body shape and plastron pattern (Spangler and Perkins 1989; Jäch *et al.* 2016; González-Córdoba *et al.* 2020), *Stenhelmooides* is poorly represented in collections. Moreover, the genus is mainly known from light-trapped specimens and its larva was only discovered a few months ago (González-Córdoba *et al.* 2020). Most of the extant bionomic information on *Stenhelmooides* is provided by Spangler and Perkins (1989), who did not describe special habitat preferences or conditions associated with the specimens. Based on Spangler and Perkins (1989), *Stenhelmooides* specimens may be found in a variety of substrates and in different kinds of Neotropical streams. Nevertheless, during our several collections in various parts of Brazil, they were not easily found. From all the material examined in this work, only the two *S. strictifrons* specimens

from Goiás state, Brazil (see Barbosa *et. al.* 2013) came from aquatic samples.

## CONCLUSIONS

The male genitalia are one of the main morphological structures for species determination in many beetle families (Crowson 1981) and Elmidae are no different. *Stenhelmooides strictifrons* is the most common and widespread species of the genus in Brazil and the miss-illustrated male genitalia was a barrier to the species determination, especially for local researchers without easy access to the type specimens. By correctly illustrating the male genitalia, we enable accurate species identification for *S. strictifrons*. Currently, *Stenhelmooides* is reported from 15 countries across the Americas (Spangler and Perkins 1989; Jäch *et al.* 2016; González-Córdoba *et al.* 2020). Here we provide four new species records for the genus in Brazil, making Brazil one of the most diverse countries for the genus, alongside Venezuela, with seven known species (Jäch *et al.* 2016). We also increase the known distribution of *Stenhelmooides* in Brazil to eleven states (previously known from six), representing four of the five Brazilian geographical regions (North, Northeast, Midwest and Southeast) and three of the six Brazilian biomes (Amazon, Atlantic rainforest and Brazilian savanna) (IBGE 2019). Finally, we provided updates to the original descriptions, photographs of all *Stenhelmooides* species known from Brazil and valuable photographs of the type specimens for the five species to which we had access. This additional information is an important supplement to the literature, especially concerning the Brazilian *Stenhelmooides* fauna.

## ACKNOWLEDGMENTS

We thank Dr. Antoine Mantilleri, Dr. Thierry Deuve, and Azadeh Taghavian (Muséum National d'Histoire Naturelle, France), for perfect conditions during a week stay in the Coleoptera Collection. The Coleoptera Curatorial Team of the Natural History Museum (UK) are warmly thanked for their support. We are greatful to Dr. Neusa Hamada, Dr. Jeane Cavalcante, Dr. Márcio Oliveira (Instituto Nacional de Pesquisas da Amazônia, Brazil), Dr. Leandro Oliveira (Universidade Federal de Goiás, Brazil), Dr. Fernando Vaz-de-Mello (Universidade Federal de Mato Grosso, Brazil), Dr. Sônia Casari (Museu de Zoologia da Universidade de São Paulo, Brazil), Dr. Adolfo Calor (Universidade Federal da Bahia, Brazil) and Dr. Tiago Kutter Krolow (Universidade Federal do Tocantins, Brazil), for providing all laboratorial conditions and assistance for collecting and/or studying the material. We thank Dr. Talita Roell (Museu de Zoologia da Universidade de São Paulo) for the support with taxonomy doubts. We also thank the reviewers and Max Barclay (NHMUK) for their suggestions and English review. TTSP thanks FAPESP (Fundação de Amparo à Pesquisa do Estado

de São Paulo, grants nr. 2015/17064-7 and 2016/21184-0) and CAPES (Coordenação de Aperfeiçoamento de Pessoal de Nível Superior) for scholarships.
